### **Difference Between Theoretical and Experimental Probability**

Theoretical probability is a probability that is expected, for example when I flip a coin 100 times I expect tails to come up 50 times and heads to come up 50 times. The theoretical probability is 0.5 for a head. However, if I perform an experiment and flip a coin 100 times, tails might come up 44 times and heads 56 times.

When you talk about the difference between theoretical and experimental probability, the theoretical probability is based on expectations. It is based on estimations and assumptions. On the other hand, the experimental probability is the actual set of results produced after the calculations have been completed.

### **Theoretical Probability Versus Experimental Probability**

The theoretical probability is 8.3% and the experimental probability is 4%. Although the experimental probability is slightly lower, this is not a significant difference. In most experiments, the theoretical probability and experimental probability will not be equal; however, they should be relatively close.

## **Theoretical Probability & Experimental Probability ...**

In experimental probability, the success and the failure of the concerned event are measured/counted in a selected sample and then the probability is calculated. In theoretical probability, a mathematical model is used to determine the behaviour responses to an event within the considered sample or the population. Consider a bag containing 3 blue balls, 3 red balls, and 4 Yellow balls. If we calculate the probability of getting a red ball using probability theory, it is  $\frac{3}{10}$ .

## **Holt Algebra 2 Lesson 7 2 Practice B Theoretical And ...**

The theoretical probability is 50% heads, 50% tails. The actual outcome of your experiment may be 47 heads, 53 tails. So the experimental probability of getting tails in 100 trials is 53%, and 47 for getting heads in 100 trials. Comment on Mark Geary's post
